Charlotte Douglas International Airport North Terminal Expansion Charlotte, NC

Architect:

Design C and Perkins + Will

Lighting Designer:

Hartranft Lighting Design
(Completed Summer 2018)

Hartranft Lighting Design developed a lighting approach in close collaboration with the design teams from C Design and Perkins + Will. The objective for both the lighting and architectural design was to create an open, bright environment accented with areas of interest and comfort.

LED fixtures were used to provide a cost effective, sustainable solution and for their color changing capabilities. White linear LED fixtures along the curved ceilings of the

Terminal emphasize the openness of the architecture and provide even illumination, supplementing the daylight from the skylights and windows when possible and maintaining an open, bright environment at night. Color changing LEDs and controls were added to provide dynamic accenting to compliment the interactive media walls in the expansion connector and terminal.
